# CROSS ORIGIN RESOURCE SHARING

# CROSS ORIGIN RESOURCE SHARING

# ISSUE

CORS is managed by HTTP servers – they may require CORS

The browser knows we have several ports open

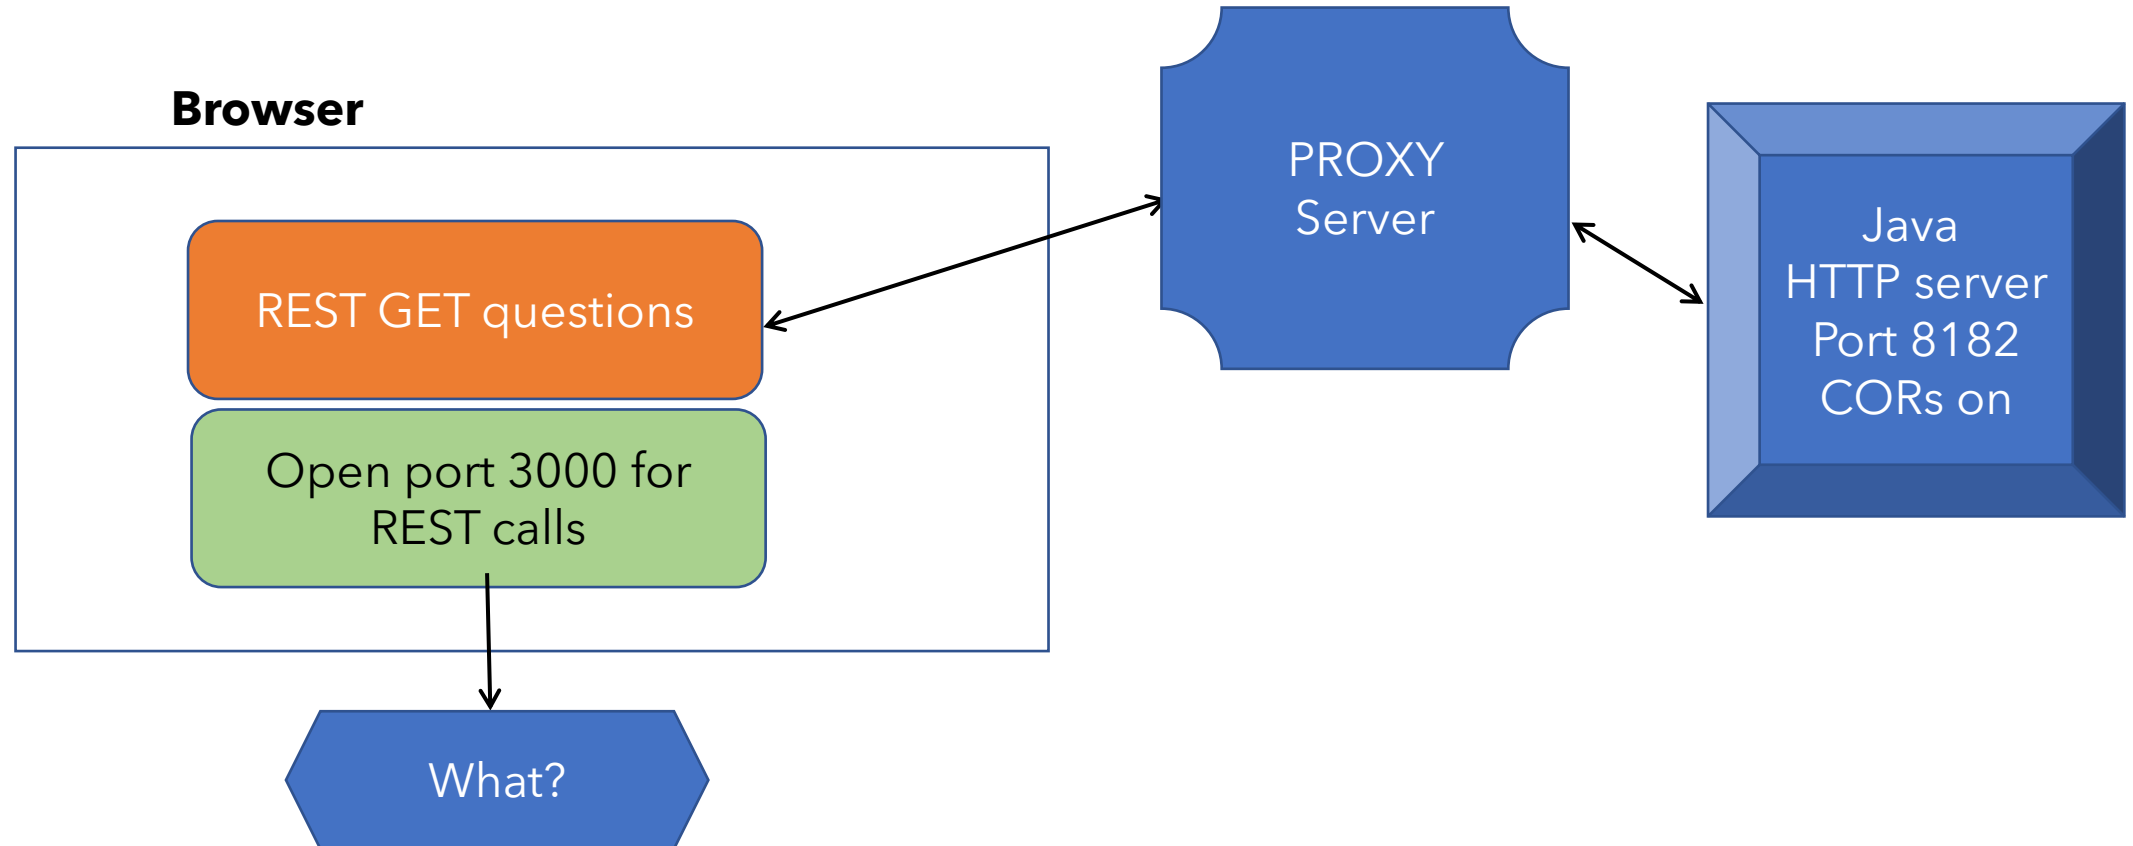

Not a good idea to allow Cross origin resource sharing for some HTTP servers

The server requires more work to get to allowing no-cors mode

May not be a good idea

Could white list guests (REST callers) - constrains system

# SEVERAL SOLUTIONS

# PROXY

Can have its own security

Add security

Can white-list/black-list

Handles CORs issues – by having its own CORS set for the HTTP side...
